# The M/EEG inverse problem: modeling

**Multiple repetitions ( $r$ ) of experiments:  
 $r = 5$  (top),  $r = 10$  (middle),  $r = 50$  (bottom)  
repetitions**

# A multi-task framework

Multi-task regression notation:

- ▶  $n$  observations (e.g., number of sensors)
- ▶  $q$  tasks (e.g., temporal information)
- ▶  $p$  features (e.g., spatial description)
- ▶  $r$  number of repetitions for the experiment
- ▶  $Y^{(1)}, \dots, Y^{(r)} \in \mathbb{R}^{n \times q}$  observation matrices;  $\bar{Y} = \frac{1}{r} \sum_l Y^{(l)}$
- ▶  $X \in \mathbb{R}^{n \times p}$  forward matrix

$$Y^{(l)} = XB^* + SE^{(l)}, \quad \text{where}$$

- ▶  $B^* \in \mathbb{R}^{p \times q}$  : true source activity matrix (**unknown**)
- ▶  $S \in \mathbb{S}_{++}^n$  co-standard deviation matrix<sup>(2)</sup> (**unknown**)
- ▶  $E^{(1)}, \dots, E^{(r)} \in \mathbb{R}^{n \times q}$  : white Gaussian noise

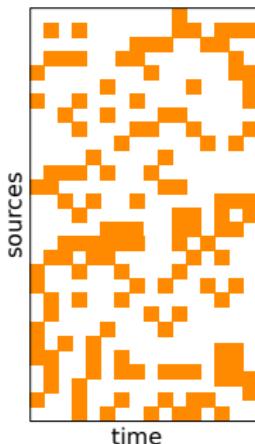

---

<sup>(2)</sup>  $S \succeq \underline{\sigma}$  means  $S - \underline{\sigma} \text{ Id}_n$  is Semi-Definite Positive

# Multi-tasks penalties<sup>(3)</sup>

Popular convex penalties considered:

$$\hat{B} \in \arg \min_{B \in \mathbb{R}^{p \times q}} \left( \frac{1}{2nq} \left\| \bar{Y} - XB \right\|^2 + \lambda \Omega(B) \right)$$

Sparse support: no structure

Penalty: **Lasso type**

$$\Omega(B) = \|B\|_1 = \sum_{j=1}^p \sum_{k=1}^q |B_{j,k}|$$

Parameter  $\hat{B} \in \mathbb{R}^{p \times q}$

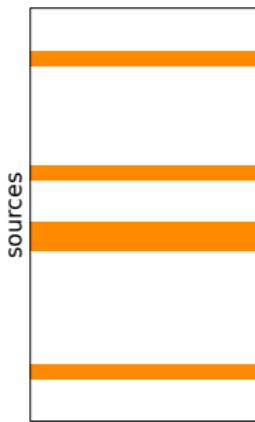

---

<sup>(3)</sup> G. Obozinski, B. Taskar, and M. I. Jordan. "Joint covariate selection and joint subspace selection for multiple classification problems". In: *Statistics and Computing* 20.2 (2010), pp. 231–252.

## Multi-tasks penalties<sup>(3)</sup>

Popular convex penalties considered: Multi-Task Lasso (MTL)

$$\hat{B} \in \arg \min_{B \in \mathbb{R}^{p \times q}} \left( \frac{1}{2nq} \left\| \bar{Y} - XB \right\|^2 + \lambda \Omega(B) \right)$$

Sparse support: group structure

Penalty: **Group-Lasso type**

$$\Omega(B) = \|B\|_{2,1} = \sum_{j=1}^p \|B_{j,:}\|_2$$

where  $B_{j,:}$ : the  $j$ -th row of  $B$

Parameter  $\hat{B} \in \mathbb{R}^{p \times q}$

---

<sup>(3)</sup> G. Obozinski, B. Taskar, and M. I. Jordan. "Joint covariate selection and joint subspace selection for multiple classification problems". In: *Statistics and Computing* 20.2 (2010), pp. 231–252.

## Multi-tasks data-fitting term

- ▶ Classical multi-tasks estimator: use averaged signal

$$\hat{\mathbf{B}} \in \arg \min_{\mathbf{B} \in \mathbb{R}^{p \times q}} \left( \frac{1}{2nq} \left\| \bar{\mathbf{Y}} - \mathbf{X}\mathbf{B} \right\|_F^2 + \lambda \Omega(\mathbf{B}) \right)$$

- ▶ How to take advantage of the number of repetitions ?

## Multi-tasks data-fitting term

- ▶ Classical multi-tasks estimator: use averaged signal

$$\hat{B} \in \arg \min_{B \in \mathbb{R}^{p \times q}} \left( \frac{1}{2nq} \left\| \bar{Y} - XB \right\|_F^2 + \lambda \Omega(B) \right)$$

- ▶ How to take advantage of the number of repetitions ?

- ▶ Intuitive estimator:

$$\hat{B}^{\text{repet}} \in \arg \min_{B \in \mathbb{R}^{p \times q}} \left( \frac{1}{2nqr} \sum_{l=1}^r \left\| Y^{(l)} - XB \right\|_F^2 + \lambda \Omega(B) \right)$$

# Multi-tasks data-fitting term

- ▶ Classical multi-tasks estimator: use averaged signal

$$\hat{B} \in \arg \min_{B \in \mathbb{R}^{p \times q}} \left( \frac{1}{2nq} \left\| \bar{Y} - XB \right\|_F^2 + \lambda \Omega(B) \right)$$

- ▶ How to take advantage of the number of repetitions ?
- ▶ Intuitive estimator:

$$\hat{B}^{\text{repet}} \in \arg \min_{B \in \mathbb{R}^{p \times q}} \left( \frac{1}{2nqr} \sum_{l=1}^r \left\| Y^{(l)} - XB \right\|_F^2 + \lambda \Omega(B) \right)$$

- ▶ It's a fail!  $\hat{B}^{\text{repet}} = \hat{B}$  (because of data-fitting loss  $\|\cdot\|_F^2$ )

# Multi-tasks data-fitting term

- ▶ Classical multi-tasks estimator: use averaged signal

$$\hat{\mathbf{B}} \in \arg \min_{\mathbf{B} \in \mathbb{R}^{p \times q}} \left( \frac{1}{2nq} \left\| \bar{\mathbf{Y}} - \mathbf{X}\mathbf{B} \right\|_F^2 + \lambda \Omega(\mathbf{B}) \right)$$

- ▶ How to take advantage of the number of repetitions ?
- ▶ Intuitive estimator:

$$\hat{\mathbf{B}}^{\text{repet}} \in \arg \min_{\mathbf{B} \in \mathbb{R}^{p \times q}} \left( \frac{1}{2nqr} \sum_{l=1}^r \left\| \mathbf{Y}^{(l)} - \mathbf{X}\mathbf{B} \right\|_F^2 + \lambda \Omega(\mathbf{B}) \right)$$

- ▶ It's a fail!  $\hat{\mathbf{B}}^{\text{repet}} = \hat{\mathbf{B}}$  (because of data-fitting loss  $\|\cdot\|_F^2$ )
- ▶ A priori  $\hat{\mathbf{B}}^{\text{repet}} \neq \hat{\mathbf{B}}$  if the data-fitting is not  $\|\cdot\|_F^2$ , for instance  $\|\cdot\|_F$  or  $\|\cdot\|_{s,1}$  (Schatten-1 norm = trace / nuclear norm)

# Multi-tasks data-fitting term

- ▶ Classical multi-tasks estimator: use averaged signal

$$\hat{B} \in \arg \min_{B \in \mathbb{R}^{p \times q}} \left( \frac{1}{2nq} \left\| \bar{Y} - XB \right\|_F^2 + \lambda \Omega(B) \right)$$

- ▶ How to take advantage of the number of repetitions ?
- ▶ Intuitive estimator:

Calibrating  $\lambda$  and noise level estimation

Multi-task case and noise structure

Experiments

## Step back on the Lasso case ( $q = 1$ )

Sparse Gaussian model:  $y = X\beta^* + \sigma_*\varepsilon$

- ▶  $y \in \mathbb{R}^n$ : observation
- ▶  $X \in \mathbb{R}^{n \times p}$ : design matrix
- ▶  $\beta^* \in \mathbb{R}^p$ : signal to recover; **unknown**
- ▶  $\|\beta^*\|_0 = s^*$ : sparsity level (small w.r.t.  $p$ );  $s^*$  **unknown**
- ▶  $\varepsilon \sim \mathcal{N}(0, \text{Id}_n)$  and  $\sigma_*$  **unknown**

Lasso reminder :

$$\hat{\beta}^{(\lambda)} \in \arg \min_{\beta \in \mathbb{R}^p} \frac{1}{2n} \|y - X\beta\|^2 + \lambda \|\beta\|_1$$

# Lasso theory<sup>(4), (5)</sup>

## Theorem

For Gaussian noise model and  $X$  satisfying the “Restricted Eigenvalue” property, for  $\lambda = 2\sigma_* \sqrt{\frac{2 \log(p/\delta)}{n}}$ , then

$$\frac{1}{n} \|X\beta^* - X\hat{\beta}^{(\lambda)}\|^2 \leq \frac{18}{\kappa_{s^*}^2} \frac{\sigma_*^2 s^*}{n} \log\left(\frac{p}{\delta}\right)$$

with probability  $1 - \delta$ , where  $\hat{\beta}^{(\lambda)}$  is a Lasso solution

---

Rem: optimal rate in the minimax sense (up to constant/ $\log$  term)

Rem:  $\kappa_{s^*}^2$  controls the conditioning of  $X$  when extracting the  $s^*$  columns of  $X$  associated to the true support

**BUT**  $\sigma_*$  is unknown in practice !

## Joint estimation of $\beta$ and $\sigma$

How to calibrate (theoretically)  $\lambda$  when  $\sigma_*$  is unknown?

Intuitive idea: initialize  $\lambda$

- ▶ run Lasso with  $\lambda$ ; get  $\beta$
- ▶ estimate  $\sigma$ , e.g., with residual  $\sigma \leftarrow \frac{\|y - X\beta\|}{\sqrt{n}}$
- ▶ re-scale  $\lambda \propto \sigma$ , and run Lasso with it
- ▶ iterate (until convergence)

# Concomitant performance

Theorem<sup>(10), (11)</sup>

For Gaussian noise model and  $X$  satisfying the “Restricted Eigenvalue” property and  $\lambda = 2\sqrt{\frac{2 \log(p/\delta)}{n}}$ , then

$$\frac{1}{n} \|X\beta^* - X\hat{\beta}^{(\lambda)}\|^2 \leq \frac{18}{\kappa_{s^*}^2} \frac{\sigma_*^2 s_*}{n} \log\left(\frac{p}{\delta}\right)$$

with high probability, where  $\hat{\beta}^{(\lambda)}$  is a Concomitant Lasso solution

---

Rem: provide same rate as Lasso, **without knowing**  $\sigma_*$

Rem:  $\lambda$  has no dimension, but calibration still needed in practice...

## Link with $\sqrt{\text{Lasso}}^{(12)}$

- ▶ Independently,  $\sqrt{\text{Lasso}}$  analyzed to get “ $\sigma$  free” choice of  $\lambda$

$$\boxed{\hat{\beta}_{\sqrt{\text{Lasso}}}^{(\lambda)} \in \arg \min_{\beta \in \mathbb{R}^p} \left( \frac{1}{\sqrt{n}} \|y - X\beta\| + \lambda \|\beta\|_1 \right)}$$

- ▶ Connections with Concomitant Lasso:

$(\hat{\beta}_{\sqrt{\text{Lasso}}}^{(\lambda)}, \hat{\sigma}_{\sqrt{\text{Lasso}}}^{(\lambda)})$  is solution of the Concomitant Lasso when

$$\hat{\sigma}_{\sqrt{\text{Lasso}}}^{(\lambda)} = \frac{\|y - X\hat{\beta}_{\sqrt{\text{Lasso}}}^{(\lambda)}\|}{\sqrt{n}} \neq 0$$

Rem: non-smooth data fitting term with non-smooth regularization

---

<sup>(12)</sup> A. Belloni, V. Chernozhukov, and L. Wang. "Square-root Lasso: pivotal recovery of sparse signals via conic programming". In: *Biometrika* 98.4 (2011), pp. 791–806.

# The Smoothed Concomitant Lasso<sup>(14)</sup>

$$(\hat{\beta}^{(\lambda)}, \hat{\sigma}^{(\lambda)}) \in \arg \min_{\beta \in \mathbb{R}^p, \sigma \geq \underline{\sigma}} \frac{\|y - X\beta\|^2}{2n\sigma} + \frac{\sigma}{2} + \lambda \|\beta\|_1$$

- ▶ useful for optimization with small  $\lambda$
- ▶ with prior information on the minimal noise level, one can set  $\underline{\sigma}$  as this bound (recovers Concomitant Lasso)
- ▶ setting  $\underline{\sigma} = \epsilon$ , smoothing theory asserts that  $\frac{\epsilon}{2}$ -solutions for the smoothed problem provide  $\epsilon$ -solutions for the  $\sqrt{\text{Lasso}}$ <sup>(13)</sup>

---

**Huber function:**  $\omega(t) = \frac{t^2}{2}$

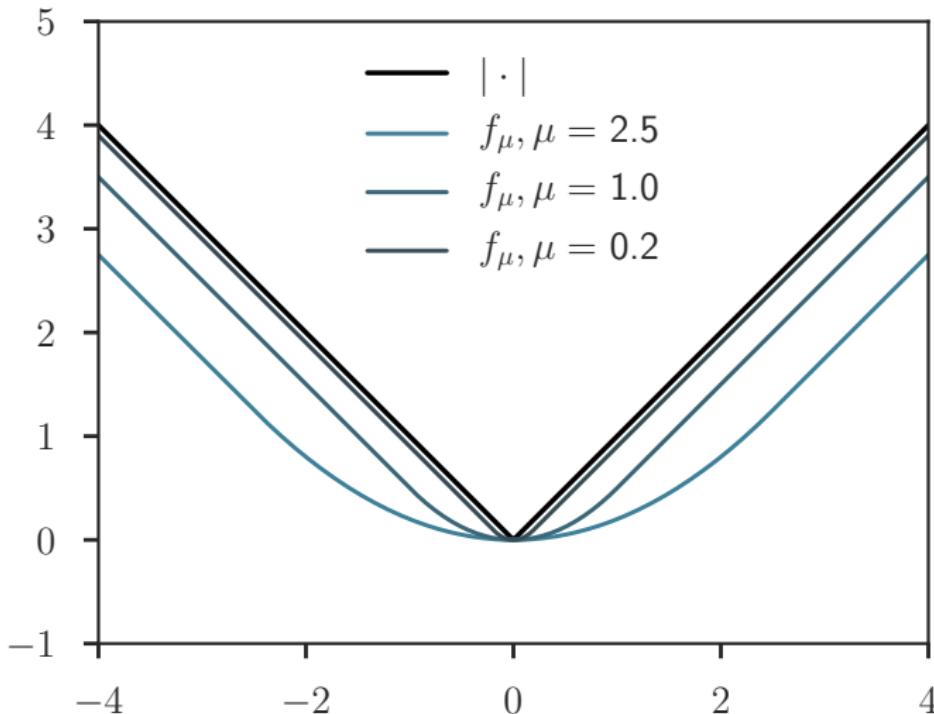

**Huber function:**  $\omega(t) = \frac{t^2}{2}$

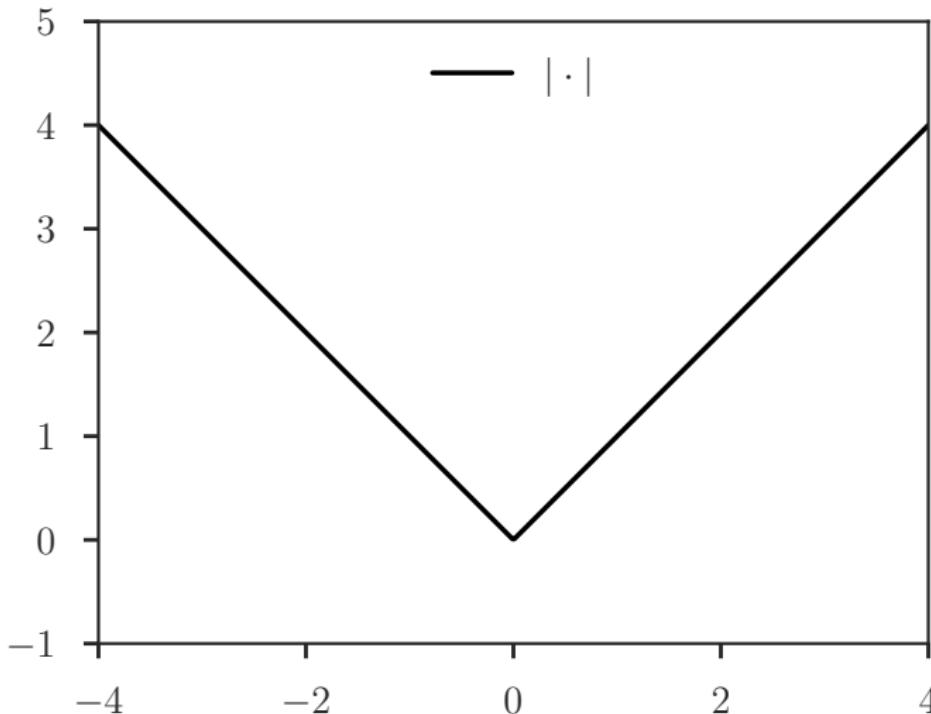

**Huber function:**  $\omega(t) = \frac{t^2}{2}$

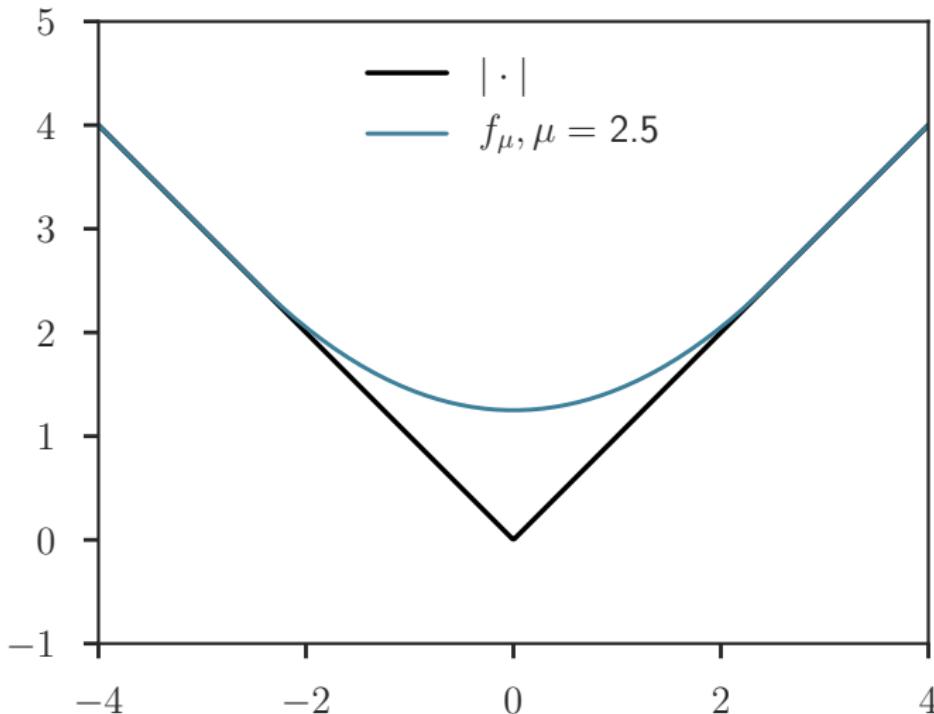

**Huber function:**  $\omega(t) = \frac{t^2}{2}$

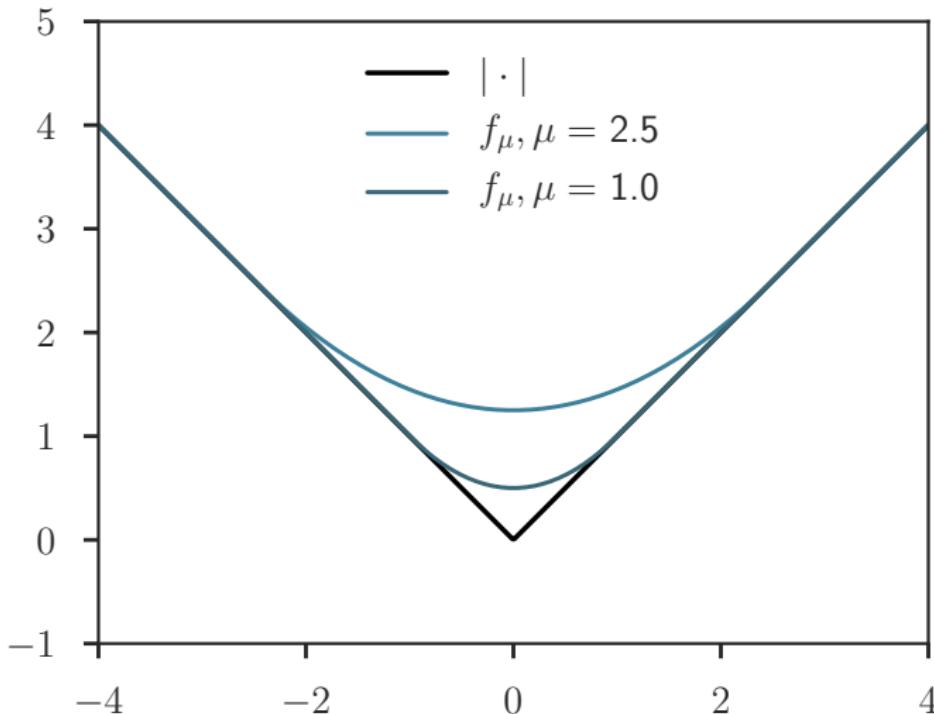

**Huber function (bis):**  $\omega(t) = \frac{t^2}{2} + \frac{1}{2}$

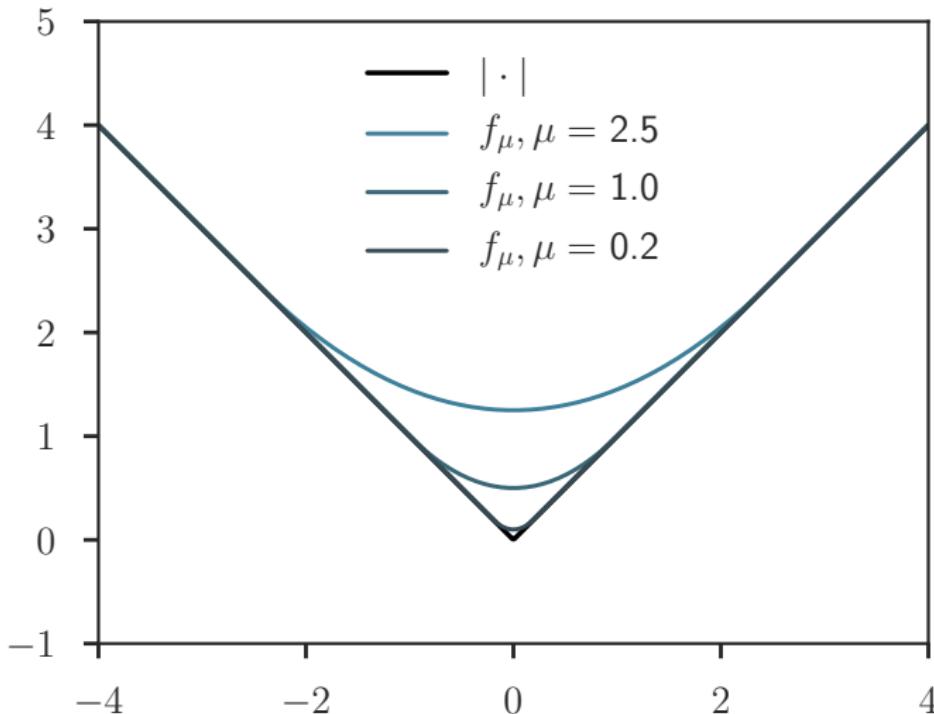

**Huber function (bis):**  $\omega(t) = \frac{t^2}{2} + \frac{1}{2}$

**Huber function (bis):**  $\omega(t) = \frac{t^2}{2} + \frac{1}{2}$

**Huber function (bis):**  $\omega(t) = \frac{t^2}{2} + \frac{1}{2}$

# Huberization of the $\sqrt{\text{Lasso}}$

“Huberization”:  $f(z) = \|z\|$ ,  $\mu = \underline{\sigma}$ ,  $\omega(z) = \frac{\|z\|^2}{2} + \frac{1}{2}$

$$\|\cdot\| \square_{\underline{\sigma}} \omega \left( \frac{\cdot}{\underline{\sigma}} \right) (z) = \begin{cases} \frac{\|z\|^2}{2\underline{\sigma}} + \frac{\underline{\sigma}}{2}, & \text{if } \|z\| \leq \underline{\sigma} \\ \|z\|, & \text{if } \|z\| > \underline{\sigma} \end{cases}$$
$$= \min_{\sigma \geq \underline{\sigma}} \left( \frac{\|z\|^2}{2\sigma} + \frac{\sigma}{2} \right)$$

Leads to the Smoothed Concomitant Lasso formulation:

$$(\hat{\beta}^{(\lambda)}, \hat{\sigma}^{(\lambda)}) \in \arg \min_{\beta \in \mathbb{R}^p, \sigma \geq \underline{\sigma}} \left( \frac{\|y - X\beta\|^2}{2n\sigma} + \frac{\sigma}{2} + \lambda \|\beta\|_1 \right)$$

# Solving the Smooth Concomitant Lasso

$$(\hat{\beta}^{(\lambda)}, \hat{\sigma}^{(\lambda)}) \in \arg \min_{\beta \in \mathbb{R}^p, \sigma \geq \underline{\sigma}} \frac{\|y - X\beta\|^2}{2n\sigma} + \frac{\sigma}{2} + \lambda \|\beta\|_1$$

**Jointly convex** formulation : can be optimized by alternate minimization w.r.t.  $\beta$  and  $\sigma$  (gradient Lipschitz)

Alternate iteratively:

- ▶ Fix  $\sigma$ : (approximatively) solve a Lasso problem to update  $\beta$

$$\hat{\beta} \in \arg \min_{\beta \in \mathbb{R}^p} \frac{\|y - X\beta\|^2}{2n} + \lambda\sigma \|\beta\|_1 \quad (\text{Lasso step})$$

# Solving the Smooth Concomitant Lasso

$$(\hat{\beta}^{(\lambda)}, \hat{\sigma}^{(\lambda)}) \in \arg \min_{\beta \in \mathbb{R}^p, \sigma \geq \underline{\sigma}} \frac{\|y - X\beta\|^2}{2n\sigma} + \frac{\sigma}{2} + \lambda \|\beta\|_1$$

**Jointly convex** formulation : can be optimized by alternate minimization w.r.t.  $\beta$  and  $\sigma$  (gradient Lipschitz)

Alternate iteratively:

- ▶ Fix  $\sigma$ : (approximatively) solve a Lasso problem to update  $\beta$

$$\hat{\beta} \in \arg \min_{\beta \in \mathbb{R}^p} \frac{\|y - X\beta\|^2}{2n} + \lambda\sigma \|\beta\|_1 \quad (\text{Lasso step})$$

- ▶ Fix  $\beta$ : closed form solution to update  $\sigma$

$$\hat{\sigma} = \max \left( \frac{\|y - X\beta\|}{\sqrt{n}}, \underline{\sigma} \right) \quad (\text{Noise estimation step})$$

# Solving the Smooth Concomitant Lasso

$$(\hat{\beta}^{(\lambda)}, \hat{\sigma}^{(\lambda)}) \in \arg \min_{\beta \in \mathbb{R}^p, \sigma \geq \underline{\sigma}} \frac{\|y - X\beta\|^2}{2n\sigma} + \frac{\sigma}{2} + \lambda \|\beta\|_1$$

**Jointly convex** formulation : can be optimized by alternate minimization w.r.t.  $\beta$  and  $\sigma$  (gradient Lipschitz)

Alternate iteratively:

- ▶ Fix  $\sigma$ : (approximatively) solve a Lasso problem to update  $\beta$

$$\hat{\beta} \in \arg \min_{\beta \in \mathbb{R}^p} \frac{\|y - X\beta\|^2}{2n} + \lambda\sigma \|\beta\|_1 \quad (\text{Lasso step})$$

- ▶ Fix  $\beta$ : closed form solution to update  $\sigma$

$$\hat{\sigma} = \max \left( \frac{\|y - X\beta\|}{\sqrt{n}}, \underline{\sigma} \right) \quad (\text{Noise estimation step})$$

# Table of Contents

Calibrating  $\lambda$  and noise level estimation

Multi-task case and noise structure

Experiments

## Back to multi-task : $Y^{(l)} = XB^* + SE^{(l)}$

General case:  $Y \in \mathbb{R}^{n \times q}$ ,  $B \in \mathbb{R}^{p \times q}$ , and the noise  $E \in \mathbb{R}^{n \times q}$  might have some structure evolving along the  $n$  samples (sensors)

“Huberization of the Frobenius norm”

$$\begin{aligned}\|\cdot\|_F \square_{\underline{\sigma}} \omega \left( \frac{\cdot}{\underline{\sigma}} \right) (Z) &= \begin{cases} \frac{\|Z\|_F^2}{2\underline{\sigma}} + \frac{\underline{\sigma}}{2}, & \text{if } \|Z\| \leq \underline{\sigma} \\ \|Z\|_F, & \text{if } \|Z\| > \underline{\sigma} \end{cases} \\ &= \min_{\sigma \geq \underline{\sigma}} \left( \frac{\|Z\|_F^2}{2\sigma} + \frac{\sigma}{2} \right)\end{aligned}$$

Leads to the Smoothed Concomitant Lasso formulation:

$$(\hat{B}^{(\lambda)}, \hat{\sigma}^{(\lambda)}) \in \arg \min_{B \in \mathbb{R}^{p \times q}, \sigma \geq \underline{\sigma}} \left( \frac{\|Y - XB\|_F^2}{2n\sigma} + \frac{\sigma}{2} + \lambda \|B\|_{2,1} \right)$$

and similar efficient algorithms.

## Back to multi-task : $Y^{(l)} = XB^* + SE^{(l)}$

General case:  $Y \in \mathbb{R}^{n \times q}$ ,  $B \in \mathbb{R}^{p \times q}$ , and the noise  $E \in \mathbb{R}^{n \times q}$  might have some structure evolving along the  $n$  samples (sensors)

### “Huberization of the Frobenius norm”

$$\begin{aligned}\|\cdot\|_F \square_{\underline{\sigma}} \omega \left( \frac{\cdot}{\underline{\sigma}} \right) (Z) &= \begin{cases} \frac{\|Z\|_F^2}{2\underline{\sigma}} + \frac{\underline{\sigma}}{2}, & \text{if } \|Z\| \leq \underline{\sigma} \\ \|Z\|_F, & \text{if } \|Z\| > \underline{\sigma} \end{cases} \\ &= \min_{\sigma \geq \underline{\sigma}} \left( \frac{\|Z\|_F^2}{2\sigma} + \frac{\sigma}{2} \right)\end{aligned}$$

Leads to the Smoothed Concomitant Lasso formulation:

$$(\hat{B}^{(\lambda)}, \hat{\sigma}^{(\lambda)}) \in \arg \min_{B \in \mathbb{R}^{p \times q}, \sigma \geq \underline{\sigma}} \left( \frac{\|Y - XB\|_F^2}{2n\sigma} + \frac{\sigma}{2} + \lambda \|B\|_{2,1} \right)$$

and similar efficient algorithms.

## What about other norms ?

Trace norm (Schatten-1 norm, or nuclear norm):  $Z \in \mathbb{R}^{n \times q}$

$$\|Z\|_{s,1} = \sum_{i=1}^{n \wedge q} \gamma_i$$

where the  $\gamma_i$ 's are the singular values of  $Z$

$$\begin{aligned}\|\cdot\|_{s,1} \square \omega_{\underline{\sigma}}(Z) &= \begin{cases} \frac{1}{2\underline{\sigma}} \sum_i \gamma_i^2 - (\gamma_i \wedge \underline{\sigma} - \gamma_i)^2, & \text{if } \|Z\|_{s,1} \leq \underline{\sigma} \\ \|Z\|_F, & \text{if } \|Z\|_{s,1} > \underline{\sigma} \end{cases} \\ &= \min_{S \succeq \underline{\sigma}} \left( \frac{1}{2} \|Z\|_{S^{-1}}^2 + \frac{1}{2} \text{Tr}(S) \right)\end{aligned}$$

$$\|Z\|_{S^{-1}}^2 := \text{Tr}(Z^\top S^{-1} Z) \text{ Mahalanobis distance}$$

# Smoothing of the nuclear/trace norm

**Smoothed Generalized Concomitant Lasso (SGCL)<sup>(17)</sup>:**

$$(\hat{B}^{\text{SGCL}}, \hat{S}^{\text{SGCL}}) \in \arg \min_{\substack{B \in \mathbb{R}^{p \times q} \\ S \in \mathbb{S}_{++}^n, S \succeq \sigma}} \frac{\|\bar{Y} - XB\|_{S^{-1}}^2}{2nq} + \frac{\text{Tr}(S)}{2n} + \lambda \|B\|_{2,1}$$

**Concomitant Lasso with Repetitions (CLaR)<sup>(18)</sup>:**

$$(\hat{B}^{\text{CLaR}}, \hat{S}^{\text{CLaR}}) \in \arg \min_{\substack{B \in \mathbb{R}^{p \times q} \\ S \in \mathbb{S}_{++}^n, S \succeq \sigma}} \frac{\sum_{l=1}^r \|Y^{(l)} - XB\|_{S^{-1}}^2}{2nqr} + \frac{\text{Tr}(S)}{2n} + \lambda \|B\|_{2,1}$$

## SGCL and CLaR computations: $S$ update

### $S$ Update - B fixed:

For SGCL and CLaR the problem can be reformulated as

$$\hat{S} = \arg \min_{S \in \mathbb{S}_{++}^n, S \succeq \underline{\sigma} \text{ Id}_n} \left( \frac{1}{2n} \underbrace{\text{Tr}[Z^\top S^{-1} Z]}_{\|Z\|_{S^{-1}}^2} + \frac{1}{2n} \text{Tr}(S) \right)$$

Rem: as in the classical concomitant Lasso, at each step CLaR and SGCL estimate alternatively  $B$  and  $S$

## SGCL and CLaR computations: $S$ update

### $S$ Update - $B$ fixed:

For SGCL and CLaR the problem can be reformulated as

$$\hat{S} = \arg \min_{S \in \mathbb{S}_{++}^n, S \succeq \underline{\sigma} \text{ Id}_n} \left( \frac{1}{2n} \underbrace{\text{Tr}[Z^\top S^{-1} Z]}_{\|Z\|_{S^{-1}}^2} + \frac{1}{2n} \text{Tr}(S) \right)$$

Closed-form solution (Spectral clipping):

if  $U^\top \text{diag}(s_1, \dots, s_n) U$  is the spectral decomposition of  $ZZ^\top$ :

$$\hat{S} = U^\top \text{diag}(\max(\underline{\sigma}, \sqrt{s_1}), \dots, \max(\underline{\sigma}, \sqrt{s_n})) U$$

Rem: as in the classical concomitant Lasso, at each step CLaR and SGCL estimate alternatively  $B$  and  $S$

# Main drawbacks

- ▶ Statistically<sup>(24)</sup>:  $\mathcal{O}(n^2)$  parameters to estimate for  $S$ 
  - SGCL case: only  $nq$  observations (need  $q$  large w.r.t.  $n$ )
  - CLaR case: only  $nqr$  observations
- ▶ Computationally:  $S$  update cost is  $\mathcal{O}(n^3)$  too slow in general (SVD computation)  
Rem: fine for MEG/EEG problems ( $n \approx 300$ )

More structure can easily be incorporated to estimate  $S$ ,  
e.g., block diagonal, etc.

---

<sup>(24)</sup>not to mention that the original model is not identifiable

## Main drawbacks

Calibrating  $\lambda$  and noise level estimation

Multi-task case and noise structure

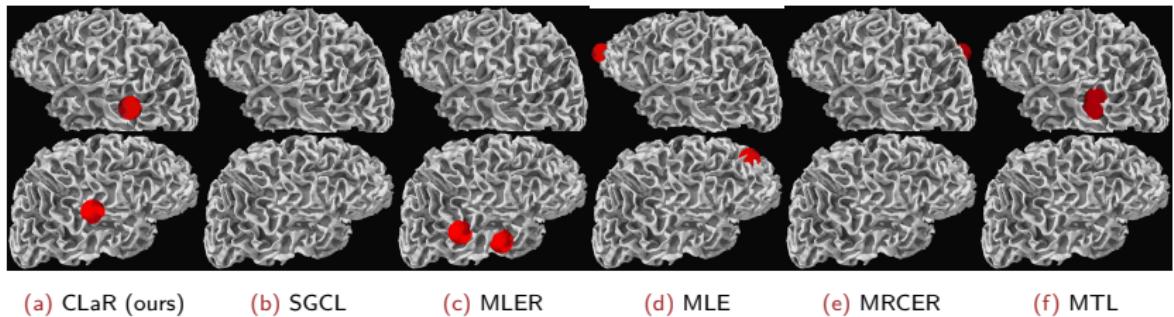

Experiments

## Simulated scenarios

- $n = 150, p = 500, q = 100$
- $X$  Toeplitz-correlated:  $\text{Cov}(X_i, X_j) = \rho^{|i-j|}, \rho_X \in ]0, 1[$
- $S^*$  Toeplitz matrix:  $S^*_{i,j} = \rho_S^{|i-j|}, \rho_{S^*} \in ]0, 1[$

# Real data

**Figure:** Real data, left auditory stimulations ( $n = 102$ ,  $p = 7498$ ,  $q = 76$ ,  $r = 63$ ) Sources found in the left hemisphere (top) and the right hemisphere (bottom) after left auditory stimulations.

- ▶ expected: 2 sources (one in each auditory cortex)
- ▶  $\lambda$  chosen such that  $\|\hat{\mathbf{B}}\|_{2,0} = 2$
- ▶ deep sources for SGCL and  $\ell_{2,1}$ -MRCER (not visible)

## Conclusion and perspectives

- ▶ New insights for handling (structured) noise in multi-task
- ▶ Handling refined noise structure benefits:  
improve support identification (and prediction)

## Conclusion and perspectives

- ▶ New insights for handling (structured) noise in multi-task
- ▶ Handling refined noise structure benefits:  
improve support identification (and prediction)
- ▶ Numerical cost equivalent to classical Multi-Task Lasso for  
“simple” noise structure (e.g., block homoscedastic)

## Conclusion and perspectives

- ▶ New insights for handling (structured) noise in multi-task
- ▶ Handling refined noise structure benefits:  
improve support identification (and prediction)
- ▶ Numerical cost equivalent to classical Multi-Task Lasso for  
“simple” noise structure (e.g., block homoscedastic)
- ▶ Future work: non-convex penalties, statistical analysis, etc.

## Conclusion and perspectives
